1.5 T MRI – CERVICAL SPINE WITH SCREENING OF WHOLE SPINE

Sequences:

SAGITTAL T2 W, T1 W

AXIAL T2 W

MYELOGRAM

AXIAL MEDIC 2D

WHOLE SPINE SCREENING: T2 W SAG.

Cervical spine:

Early degenerative changes in cervical spine. Straightening of cervical spine.

Tiny postero-central disc protrusion at C3-C4 to C6-C7 levels indenting the thecal sac without significant canal/neural foramina narrowing. No cord/nerve root compression. Vertebral alignment appears normal. No evidence of subluxation / dislocation seen.

Vertebral bodies and posterior elements appear normal.

No evidence of bony destruction or abnormal marrow signal intensity changes identified.

AP canal diameters at midvertebral level (in cm) are as follows:

Level :	C2-C3	C3-C4	C4-C5	C5-C6	C6-C7	C7-D1
(Cm):	1.30	1.24	1.08	1.14	1.26	1.27

The spinal cord appears normal. No evidence of myelomalacia.

Atlanto axial articulation appears normal. No features to suggest basilar invagination / chiari malformation seen.

Pre/paravertebral soft tissues appear normal.

Screening of dorsal spine:

➤ No significant abnormality.

Screening of lumbar spine:

➤ No significant abnormality.

Impression:

- ❖ Early cervical spondylosis.
- ❖ Tiny postero-central disc protrusion at C3-C4 to C6-C7 levels indenting the thecal sac without significant canal/neural foramina narrowing. No cord/nerve root compression.

Kindly correlate with clinical findings.

Dr. PHILSON J. MULKADA, MD, FRCR (UK)
Consultant Imaging and Interventional Radiologist

MULTISLICE - CT – CHEST (PLAIN)

Observation:

The lung fields appear clear bilaterally with no focal lesions identified within.

No evidence of pulmonary collapse / consolidation

No evidence of bronchiectasis / cavitation

No centrilobular/ miliary/ tree in bud nodules. No abnormal thickening of interstitium.

No significant lymph node enlargement identified.

No pleural effusion.

The heart is orthotopic with normal configuration. The cardiac chambers are of normal size.

No significant pericardial thickening / fluid collection seen.

No obvious abnormal wall thickening / dilatation of the thoracic esophagus is seen.

No lytic/ sclerotic lesions in visualized skeleton.

Superficial soft tissues of the chest wall appear normal.

Visualized sections of liver and spleen are normal.

Impression:

❖ CT study of the chest shows no significant abnormality on non contrast scan.
